

Blocky for Veeam®

A Linux-Free Alternative to Protect Veeam® Backup Servers

Searching for a Linux-free solution to shield your Veeam backups from ransomware?

Blocky for Veeam® offers the maximum protection to harden the Windows Veeam servers, creating a **zero-trust environment** for your backup data.

Why is Blocky essential for your Veeam security strategy?

Here's what the Veeam® 2023 Ransomware Trend Report reveals:

- A staggering **93%** of ransomware attacks are aimed at backup files.
- **75%** of backup repositories are compromised in these attacks.
- **50%** of the attacked systems were reinfected during the recovery process.
- **85%** of organizations have fallen victim to at least one cyber attack in the past year, up from 76% the year before.
- **80%** of those attacked ended up paying the ransom, though many were still unable to recover their data.
- Insurance covered **77%** of the ransoms paid, but obtaining insurance is becoming increasingly difficult and costly without robust ransomware protection.

Your business can't afford to take these risks lightly. While traditional security measures and data backups are helpful, they alone cannot guarantee protection against ransomware attacks. To fortify your defenses, it is vital to ensure that your backups are immutable.

This is where Blocky comes in:

- Blocky is the only ransomware protection that runs seamlessly on VBR Windows server - no Linux required.
- Instantly creates a hardened, zero-trust environment for Veeam® backups.
- Features real-time event monitoring and alerting.
- Deploys in minutes.
- Helps meet stringent ransomware insurance requirements.

Don't leave your backups vulnerable.
